Version: 1.0

2 Introduction

The surgeons from Geelong Orthopaedics participating in the Patient Registry of Upper Limb Pathology Outcomes (PRULO) specialise in joint replacement, sports injuries, upper limb and hand surgery, and trauma. The PRULO registry collates and stores patient outcomes collected routinely as part of the standard clinical pathway for upper limb pathology treatment.

The registry comprises three patient cohorts: rotator cuff pathology, glenohumeral instability, and general shoulder pathologies. Outcomes data collected by the registry include objective joint function, patient reported outcomes (pain, satisfaction, quality of life), radiological findings, surgical treatment and rates of revision surgery or complications.

Mitek Products are used across all three cohorts. This report summarises the outcomes of the Mitek product list used within the PRULO registry for the past year.

The dataset is derived from the PRULO registry snapshot and live database tables. A protocol has been previously prepared for the registry Scholes et al. (2023).

The outline of this report has been derived from the EuroSpine Registry report supplied as an example by Bruce Robie (Mitek, JnJ MedTech) (Sep 2023) and via summary of meeting minutes provided by Tracey Mealey in email correspondence (26-Jun-2023).

3 Glossary

To clarify terms used throughout the report, a glossary is presented below.

Table 1: Glossary of terms used in report

Term	Definition
Case Failure	Patient presents in a state such that i) a repaired construct is deemed to be absent healing, or has reinjured subsequent to the index procedure ii) the shoulder presents in a state such that removal of hardware or procedure revision (single or multi-stage) is recommended
Reoperation	A theatre procedure subsequent to the index surgery that does not involve removal, replacement or modification of the construct.
Case	A definitive reconstruction procedure performed on a patient, excluding a reoperation, but including revision procedures.
Revision Else	A repeat definitive procedure performed on a case where the previous definitive procedure has been performed by another surgeon

Term	Definition
Revision Own	A repeat definitive procedure performed on a case where the previous definitive procedure has been performed by the same contributing surgeon
QuickDASH	Short form of the Disabilities of the Arm, Hand and Shoulder questionnaire. The questions are directed toward pain and disability associated with upper limb activities. A diminishing score over time reflects improved function.
WORCNorm	Western Ontario Rotator Cuff Index is a questionnaire specific to rotator cuff pathology and is scored as the sum of a series of 10mm visual analogue scales. A normalised score is calculated to convert the sum to a percentage score of normal (100%).
WORC Physical Question 3	Question 3 of the Physical subscale of the WORC asks "How much weakness do you experience in your shoulder?" and is a key indicator or rotator cuff integrity, especially after repair.
WOSINorm	Western Ontario Rotator Cuff Index is a questionnaire specific to glenohumeral instability and associated pathology and is scored as the sum of a series of 10mm visual analogue scales. A normalised score is calculated to convert the sum to a percentage score of normal (100%).

4 Data Preparation

The steps below outline the process for preparing registry data for analysis.

4.1 Load libraries

Load up required packages in advance.

4.2 Authorisations

Pre-authorise access to registry datasets.

4.3 Functions for Processing

Include a series of functions to call later in the file for processing data imports.

4.4 Import Inputs

Data was imported from the PRULO registry. Configuration tables were also loaded, including the product table to describe the products of interest and list identifiers to match to surgical records. The table was modified to include a material column (PEEK or BR) and product identifiers.

Dataframes were combined into one for further analysis.

4.5 Combine and filter for 3 month follow up

The dataset was filtered to only include records with a minimum of 3 months follow up at the time of analysis.

4.6 Prepare dataset for procedure

Procedure data was combined from all cohorts. New columns were created based on conditional statements, cases were filtered where procedure data was unavailable (non-surgical, missing intraoperative data). Procedure data was further processed to standardise labels, categorised by structure (Rotator Cuff, Labrum, Capsule and Ligament) and adjunct procedures reorganised to account for variation across surgical indication.

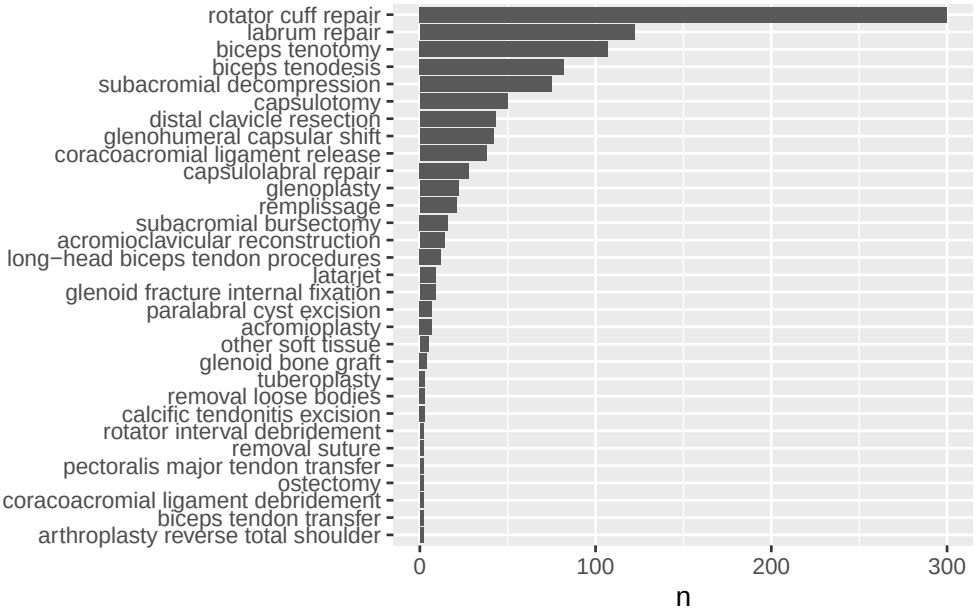

Figure 1: Summary of procedure terms included in registry output

4.7 Adjust dataset for time to event

To account for variations in follow up, time to event was calculated between date of surgery and change of record status. Treatment record end was defined as any change in state such that the treatment would be considered no longer active, has not achieved its clinical purpose or is no longer relevant. For example, in the case of soft tissue repair, if the target tissue represents with a retear, or the construct presents in a state such that hardware removal or replacement is recommended, then the treatment record status is set to inactive and a new treatment record is created to capture the subsequent treatment. The treatments with inactive statuses were extracted to a shared file for review. The subsequent treatment was manually labelled to create the *Subsequent Treatment* variable.

Additional numeric variables were calculated from inputs collected within the registry (e.g. Symptom Duration).

Read in results of manual review of failure cases and categorise subsequent treatments.

4.8 Prepare product groups of interest

Tables were rearranged and the dataset was filtered against an ignore list created from the product configuration table. Regular expressions were used to match products of interest to intraoperative hardware information and to sum the instances of implantation for each product of interest.

Identify the problematic codes that are not linking back to the ProductTable correctly

```
Discrepancies identified have been added to external table.
```

4.9 Adjust patient demographics for presentation

Recode Sex for report presentation.

4.10 Prepare patient-reported outcomes

The PRULO registry uses the QuickDASH (Gummesson, Ward, and Atroshi 2006) for all cases, Western Ontario Rotator Cuff Index (WORC) (Kirkley, Alvarez, and Griffin 2003) for records placed into the Rotator Cuff cohort and the Western Ontario Shoulder Instability Index (WOSI) (Kirkley et al. 1998) for records placed in the Glenohumeral Instability cohort to monitor patient-reported outcomes before and after surgery at defined time intervals. The metrics utilised for each questionnaire in this report are the total score (QuickDaSH) and the normalised total score (WORC and WOSI). A single question from the WORC was also presented (Question 3 of the Physical subscale) that asks "How much weakness do you experience in your shoulder?" to observe potential patterns relevant specifically to cuff repair. PROMs entries were restricted to cases where the treatment record was "eligible" for the time point. Tables were reshaped and variables refactored, with delta variables generated (difference to baseline at each followup) to enable plotting and table generation.

4.11 Prepare adverse events

Adverse events were monitored by near real-time chart review and surgical bookings. Events were added to the registry using an electronic form and linked to the treatment records. The data import was assessed for data entry validity, differences between date of event, date of reoperation and surgery date of the index treatment were calculated to assess date validity. Additional data preparation and cleaning was performed, which included filtering and standardizing key identifiers across multiple datasets. Missing values were identified to ensure data consistency. The adverse events were attached to the treatment data with filters applied to constrain to pertinent records and time periods. Time-based metrics were calculated and classification was performed based on the event descriptions using regular expressions. Finally, it conducted data quality checks, identifying potential discrepancies and duplicate entries. After the data transformation, the revised dataset

was exported to an external file for review. The code then generated multiple subset datasets, each focusing on a specific type of complication and isolating the earliest occurrence for each unique treatment. This was used for retrieval for each product report.

Split out into arrays to bounce against for each Product report

Intraoperative complications were reviewed manually for mechanism.

5 PRULO Summary

The diagram below summarises recruitment and categorisation of patients into the PRULO registry.

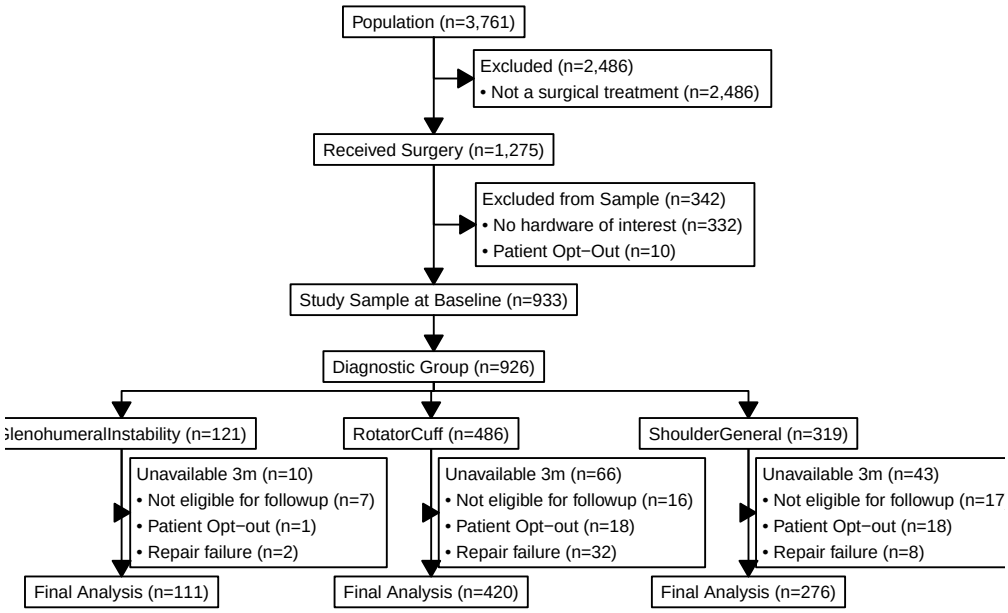

Figure 2: Flowchart of extraction and followup of sample from the Registry

Table 2: Summary of diagnoses using ICD-10 coding for primary presentation

Cohort	ICD10	n
General	M19.0	101
General	M75.0	42
General	S42.0	25
General	M12.0	17
General	S43.5	17
Glenohumeral Instability	S43.0	29
Glenohumeral Instability	S43.42	29
Glenohumeral Instability	M25.31	17
Glenohumeral Instability	M24.4	16
Glenohumeral Instability	M24.21	4

Table 2: Summary of diagnoses using ICD-10 coding for primary presentation

Cohort	ICD10	n
Rotator Cuff	M75.1	261
Rotator Cuff	S46.0	98
Rotator Cuff	S43.43	18
Rotator Cuff	M75.3	16
Rotator Cuff	S46.1	10

The table below summarises patient diagnoses in the PRULO registry. The primary pathology for a given presentation was derived from clinical notes and labelled with an ICD-10 (international) code. Each code was included in a configuration file to link to a registry cohort.

Table 3: Summary of PRULO surgical cases by coho

Characteristic	**Statistic**	**Overall N = 1,045[1]**	**General N = 428**	**Glen**
Age at Initial Consultation (Years)	Median (Q1, Q3)	58 (45, 69)	64 (50, 73)

<=0.5	% (n)	28 (135)	20 (34)	
>0.5	% (n)	72 (346)	80 (138)	
Treatment Record Active[3]	% (n)	94 (987)	96 (412)	
Patient Record Active[4]	% (n)	100 (1,041)	99 (424)	

[1]Median (Q1, Q3); % (n)

[2]Dichotomised below or equal to 0.5 years or greater than 0.5 years

[3]Treatment record remains active - no change to follow up

[4]Patient record remains open - no change to consent or mortality status

The overall registry enrolment is summarised in Table 3, describing how the population is summarised into cohorts.

6 Product Report 1 - Healix Advance PEEK with Dynacord

6.1 Sample Selection

The sample of patients with the relevant product group were identified and data were retrieved for analysis by matching registry records to the relevant stock keeping units (SKUs) for the product group of interest. Usage statistics for the product group were added, and adverse events data were attached. Patient-reported data were retrieved and the dataset was manipulated to include relevant details for procedures of interest.

6.2 Overview

Usage of the Product within the patient group is summarised below.

There are 206 cases involving the anchor of interest. Surgeries were performed between 2020-Oct-21 and 2025-Jan-07. The procedures included [Cuff Repair] [Cuff Repair; Capsulotomy] [Cuff Repair; Tenotomy; Ligament Release] [Cuff Repair; Ligament Release] [Cuff Repair; Tenotomy] [Cuff Repair; Tenodesis] [Augmented Cuff Repair; Tenodesis; Capsular Reconstruction] [Augmented Cuff Repair; Tenotomy; Capsular Reconstruction] [Augmented Cuff Repair; Capsulotomy] [Augmented Cuff Repair; Capsular Reconstruction] [Cuff Repair; Tenodesis; Ligament Release] [Augmented Cuff Repair] [Augmented Cuff Repair; Tenotomy; Ligament Release] [Augmented Cuff Repair; Tenotomy] [Augmented Cuff Repair; Ligament Release] [Cuff Repair; Tenotomy; Capsulotomy] [Augmented Cuff Repair; Tenodesis] [Cuff Repair; Capsulolabral Repair], and [Tenodesis; Labrum Repair]. There are 178 cases involving the anchor of interest and a rotator cuff repair. Surgeries were performed between 2020-Nov-10 to 2025-Jan-07. There are 22 cases involving the anchor of interest and a biceps tenodesis. Surgeries were performed between 2021-Jun-08 to 2023-Oct-25.

6.3 Procedure Report - Rotator Cuff Repair

6.3.1 Patient Characteristics

Patient demographic, pathology, and treatment characteristics for this cohort receiving the Product are summarised below.

Table 4: Summary of PRULO Report 1 (Rotator Cuff) Case - Patient Characterist

Characteristic	Statistic	Overall N = 178[1]	None N = 92	Tenodesis
Age at Initial Consultation (Years)	Median (Q1, Q3)	60 (55, 65)	59 (54, 65)	54 (49,

7 Product Report 2 - Healix Advance Knotless PEEK

7.1 Sample Selection

The sample of patients with the relevant product group were identified and data were retrieved for analysis by matching registry records to the relevant stock keeping units (SKUs) for the product group of interest. Usage statistics for the product group were added, and adverse events data were

attached. Patient-reported data were retrieved and the dataset was manipulated to include relevant details for procedures of interest.

7.2 Overview

Usage of the Product within the patient group is summarised below.

There are 219 cases involving the anchor of interest. Surgeries were performed between 2020-Oct-21 and 2025-Jan-07. The procedures included [Cuff Repair] [Cuff Repair; Capsulotomy] [Cuff Repair; Tenotomy; Ligament Release] [Cuff Repair; Ligament Release] [Cuff Repair; Tenotomy] [Cuff Repair; Tenodesis] [Augmented Cuff Repair; Tenodesis; Capsular Reconstruction] [Augmented Cuff Repair; Tenotomy; Capsular Reconstruction] [Augmented Cuff Repair; Capsulotomy] [Augmented Cuff Repair; Capsular Reconstruction] [Augmented Cuff Repair] [Augmented Cuff Repair; Tenotomy; Ligament Release] [Augmented Cuff Repair; Ligament Release] [Cuff Repair; Tenotomy; Capsulotomy] [Augmented Cuff Repair; Tenotomy], and [Augmented Cuff Repair; Tenodesis]. There are 190 cases involving the anchor of interest and a rotator cuff repair. Surgeries were performed between 2020-Nov-10 to 2025-Jan-07. There are 17 cases involving the anchor of interest and a biceps tenodesis. Surgeries were performed between 2021-Jun-10 to 2023-Oct-25.

7.3 Procedure Report - Rotator Cuff Repair

7.3.1 Patient Characteristics

Patient demographic, pathology, and treatment characteristics for this cohort receiving the Product are summarised below.

Table 18: Summary of PRULO Report 2 (Rotator Cuff) Case - Patient Characteri

Characteristic	Statistic	Overall N = 190[1]	None N = 103	Tenodesi
Age at Initial Consultation (Years)	Median (Q1, Q3)	60 (55, 65)	59 (53, 65)	53 (5
Male	% (n)	70 (133)	65 (67)	100
Cohort

8 Product Report 3 - Healix Advance Knotless BR

8.1 Sample Selection

The sample of patients with the relevant product group were identified and data were retrieved for analysis by matching registry records to the relevant stock keeping units (SKUs) for the product group of interest. Usage statistics for the product group were added, and adverse events data were

attached. Patient-reported data were retrieved and the dataset was manipulated to include relevant details for procedures of interest.

8.2 Overview

Usage of the Product within the patient group is summarised below.

There are 63 cases involving the anchor of interest. Surgeries were performed between 2021-Mar-02 and 2024-Nov-14. The procedures included [Cuff Repair] [Cuff Repair; Tenodesis] [Cuff Repair; Tenotomy] [Cuff Repair; Capsulotomy] [Augmented Cuff Repair] [Cuff Repair; Tenodesis; Capsulotomy] [Augmented Cuff Repair; Tenodesis], and [Cuff Repair; Capsulolabral Repair]. There are 62 cases involving the anchor of interest and a rotator cuff repair. Surgeries were performed between 2021-Mar-02 to 2024-Nov-14. There are 19 cases involving the anchor of interest and a biceps tenodesis. Surgeries were performed between 2021-Jun-03 to 2024-Oct-22.

8.3 Procedure Report - Rotator Cuff Repair

8.3.1 Patient Characteristics

Patient demographic, pathology, and treatment characteristics for this cohort receiving the Product are summarised below.

9 Product Report 4 - Healix Advance BR with Dynacord

9.1 Sample Selection

The sample of patients with the relevant product group were identified and data were retrieved for analysis by matching registry records to the relevant stock keeping units (SKUs) for the product group of interest. Usage statistics for the product group were added, and adverse events data were attached. Patient-reported data were retrieved and the dataset was manipulated to include relevant details for procedures of interest.

9.2 Overview

Usage of the Product within the patient group is summarised below.

There are 84 cases involving the anchor of interest. Surgeries were performed between 2021-Mar-02 and 2025-Jan-07. The procedures included [Cuff Repair; Tenodesis] [Cuff Repair] [Cuff Repair; Tenotomy] [Cuff Repair; Labrum Repair] [Cuff Repair; Capsulotomy] [Cuff Repair; Debridement; Capsulotomy] [Augmented Cuff Repair] [Cuff Repair; Tenodesis; Capsulotomy] [Augmented Cuff Repair; Tenodesis] [Augmented Cuff Repair; Capsular Reconstruction], and [Cuff Repair; Capsulolabral Repair]. There are 83 cases involving the anchor of interest and a rotator cuff repair. Surgeries were performed between 2021-Mar-02 to 2025-Jan-07. There are 27 cases involving the anchor of interest and a biceps tenodesis. Surgeries were performed between 2021-Mar-02 to 2025-Jan-07.

11 Product Report 6 - Gryphon ProKnot BR

11.1 Sample Selection

The sample of patients with the relevant product group were identified and data were retrieved for analysis by matching registry records to the relevant stock keeping units (SKUs) for the product group of interest. Usage statistics for the product group were added, and adverse events data were attached. Patient-reported data were retrieved and the dataset was manipulated to include relevant details for procedures of interest.

11.2 Overview

Usage of the Product within the patient group is summarised below.

There are 66 cases involving the anchor of interest. Surgeries were performed between 2020-Dec-02 and 2024-Nov-14. The procedures included [Cuff Repair; Labrum Repair] [Tenodesis; Labrum Repair] [Tenodesis; Capsulolabral Repair] [Cuff Repair; Tenodesis; Capsulolabral Repair] [Cuff Repair; Tenodesis] [Cuff Repair; Capsulolabral Repair] [Labrum Repair] [Capsulotomy] [Labrum Repair; Capsular Shift] [Remplissage; Labrum Repair; Capsular Shift] [Tenodesis; Labrum Repair; Capsular Shift] [Remplissage; Labrum Repair] [Capsulolabral Repair; Capsular Shift] [Remplissage; Capsulolabral Repair; Repair], and [Unknown; Labrum Repair].

There are 35 cases involving the anchor of interest and a Bankart repair. Surgeries were performed between 2021-Jul-01 to 2024-Mar-19.

There are 3 cases involving the anchor of interest and a SLAP repair. Surgeries were performed between 2022-Sep-20 to 2023-Nov-16. There is insufficient sample size to provide a report.

11.3 Procedure Report - All

13 Product Report 8 - Gryphon BR with Dynacord

13.1 Sample Selection

The sample of patients with the relevant product group were identified and data were retrieved for analysis by matching registry records to the relevant stock keeping units (SKUs) for the product group of interest. Usage statistics for the product group were added, and adverse events data were attached. Patient-reported data were retrieved and the dataset was manipulated to include relevant details for procedures of interest.

13.2 Overview

Usage of the Product within the patient group is summarised below.

There are 2 cases involving the anchor of interest. Surgeries were performed between 2022-Jul-12 and 2022-Aug-16. The procedures included [Labrum Repair].

Table 96: Summary of PRULO Report 9 (All) Cases - Intraoperative Events

TreatmentID	Description	Intervention	PostopManagement
2729.1	grphon anchor came out	Modified surgical technique	No

There is 1 case involving the anchor of interest. There is insufficient sample size to provide a report.

14 Product Report 9 - Gryphon PEEK with Dynacord

14.1 Sample Selection

The sample of patients with the relevant product group were identified and data were retrieved for analysis by matching registry records to the relevant stock keeping units (SKUs) for the product group of interest. Usage statistics for the product group were added, and adverse events data were attached. Patient-reported data were retrieved and the dataset was manipulated to include relevant details for procedures of interest.

14.2 Overview

Usage of the Product within the patient group is summarised below.

There are 9 cases involving the anchor of interest. Surgeries were performed between 2022-May-19 and 2024-Sep-25. The procedures included [Labrum Repair] [Remplissage; Labrum Repair], and [Remplissage; Labrum Repair; Capsular Shift].

There are 6 cases involving the anchor of interest and a Bankart repair. Surgeries were performed between 2022-May-19 to 2024-Jun-12.

14.3 Adverse Events

Complications and adverse events are summarised below.

`Intraoperative events occurred in 1 of 9 cases (11.1%, 95% CI: 2%-43.5%).`

Table 97: Summary of PRULO Report 4 (Rotator Cuff) Cases - Postoperative Events

15 Product Report 10 - Latarjet Screw

15.1 Sample Selection

The sample of patients with the relevant product group were identified and data were retrieved for analysis by matching registry records to the relevant stock keeping units (SKUs) for the product group of interest. Usage statistics for the product group were added, and adverse events data were attached. Patient-reported data were retrieved and the dataset was manipulated to include relevant details for procedures of interest.

15.2 Overview

Usage of the Product within the patient group is summarised below.

There are 13 cases involving the anchor of interest. Surgeries were performed between 2021-Feb-10 and 2024-Jul-17. The procedures included [Capsulolabral Repair; Other] [Labrum Repair] [Tenodesis; Labrum Repair; Capsular Shift] [Capsulotomy], and [Labrum Repair; Capsular Shift].

16 Product Report 11 - Dynacord Freestrand Suture

16.1 Sample Selection

The sample of patients with the relevant product group were identified and data were retrieved for analysis by matching registry records to the relevant stock keeping units (SKUs) for the product group of interest. Usage statistics for the product group were added, and adverse events data were attached. Patient-reported data were retrieved and the dataset was manipulated to include relevant details for procedures of interest.

16.2 Overview

Usage of the Product within the patient group is summarised below.

There are 10 cases involving the anchor of interest. Surgeries were performed between 2020-Dec-22 and 2025-Jan-07. The procedures included [Cuff Repair] [Cuff Repair; Tenodesis] [Augmented Cuff Repair; Capsular Reconstruction] [Cuff Repair; Tenotomy; Capsulotomy], and [Labrum Repair].

There are 7 cases involving the suture of interest and a Cuff repair. Surgeries were performed between 2021-Apr-15 to 2025-Jan-07. The procedures included Rotator Cuff Repair; Calcific tendinopathy, Rotator Cuff Repair, Rotator Cuff Repair; Biceps Tenodesis; Biceps Tenotomy; Sub-acromial Decompression, Rotator Cuff Repair; bicep transfer to reinforce supra repair, Rotator Cuff Repair; Biceps Tenotomy; Capsulotomy, Rotator Cuff Repair; Biceps Tenodesis.

There are 2 cases involving the suture of interest and a Biceps Tenodesis. Surgeries were performed between 2021-Jul-08 to 2022-Sep-22. There is insufficient sample size to provide a report.

16.3 Procedure Report - Rotator Cuff Repair

16.3.1 Patient Characteristics

Patient demographic, pathology, and treatment characteristics for this cohort receiving the Product are summarised below.

Table 104: Summary of PRULO Report 11 (Rotator Cuff) Case - Patient Characterist

Characteristic	Statistic	Overall N = 7[1]	None N = 4	Tenodesis
Age at Initial Consultation (Years)	Median (Q1, Q3)	54.0 (49.0, 56.0)	54.5 (51.5, 59.5)	46.5 (42.0,

17 Product Report 12 - Dynatape Freestrand Suture

17.1 Sample Selection

The sample of patients with the relevant product group were identified and data were retrieved for analysis by matching registry records to the relevant stock keeping units (SKUs) for the product group of interest. Usage statistics for the product group were added, and adverse events data were attached. Patient-reported data were retrieved and the dataset was manipulated to include relevant details for procedures of interest.

17.2 Overview

Usage of the Product within the patient group is summarised below.

There is 1 case involving the product of interest. There is insufficient sample size to provide a report.

There are 0 cases involving the suture of interest and a Cuff Repair. There is insufficient sample size to provide a report.

18 Product Report 13 - Orthocord Freestrand Suture

18.1 Sample Selection

The sample of patients with the relevant product group were identified and data were retrieved for analysis by matching registry records to the relevant stock keeping units (SKUs) for the product group of interest. Usage statistics for the product group were added, and adverse events data were attached. Patient-reported data were retrieved and the dataset was manipulated to include relevant details for procedures of interest.

18.2 Overview

Usage of the Product within the patient group is summarised below.

There are 2 cases involving the suture of interest. Surgeries were performed between 2021-Jun-10 to 2021-Jul-08. There is insufficient sample size to provide a report.

19 Product usage patterns

Product usage patterns were determined by merging multiple product datasets into a single table. This combined data was then modified to include additional information and restructured to have separate columns for different product groups. Following this, a list of product category names was established and proportions for various combinations were calculated. The results were reformatted for presentation, with count data incorporated and proportions displayed as percentages.

Table 111: Summary of product overlap for each report sample (row), the proportion of cases within that sample that also include products included in the remaining reports (columns)

	CaseCount	Healix Advance Peek with Dynacord	Healix Advanc
Healix Advance Peek with Dynacord	206	100.0

Dynacord Freestrand Suture	10	60.0	
Dynatape Freestrand Suture	1	0.0	
Orthocord Freestrand Suture	2	100.0	

19.1 Proportion with multiple products

The proportion of cases that contained hardware from different product codes was summarised.

A cross-tabulation of usage for all products was generated and written to an external file for further review.

A summary table was generated to illustrate the proportion of cases where multiple product codes were utilised.
